* I.e., rate calculated on the basis that the age- and sex-constitution of the population of each town is the same as for the whole Island, and also (as in crude rate) excluding non-residents.
^t Infantile death-rate omitted where the number of births is less than five.
[§] Blanks indicate that there are no observatories or rain-gauges.
^{||} This includes the population as added on the extension of the town limits. See note *.
[¶] Corrected death-rates for "Hatten and Dikoya," Weligama, Kalpitiya, and Lunugala towns not available, as they were created registration districts after the Census of 1901.
^{||} Estimated to the end of June, 1912, by natural increase method owing to the inability of applying the intercensal method, as the limits of the town were altered between 1901 and 1911.
^{**} Calculated for non-estate events on the population exclusive of the estate population at the Census of 1911.

* For explanation of "corrected death-rate" see note *, Table I. The population of the several wards of the city not being available by age- and sex-constitution, their corrected death-rates cannot be calculated.

† Infantile death-rates omitted where number of births is less than five.

‡ The population of these two wards being a fluctuating one, their population cannot be estimated to the middle of 1912. Hence the Census figures are retained.

§ This population is estimated partly on the natural increase method and partly on the intercensal increase method, i.e., population of Wellawatta on the former method (as it was not a separate division at the Census of 1901) and that of the part of Kollupitiya taken over to Wellawatta on the latter method.

|| For the six months, January to June, 1912.
