^a The standardized death-rates represent the crude death-rates multiplied by the respective standardizing factor in order to make correction for differences of sex- and age-constitution of the several populations in 1911, as compared with that of the island.

^b Blanks indicate that there are no observations on the part of December, 1919, by annual increase method.

^c Estimated to the Census of 1911 by age and sex, while the town of Kalmunai was created a registration division only in January, 1914, and Ambalangoda in January, 1915. The death-rates given for "All Towns" are, therefore, in 1911, but are scarcely affected by their rates.

^d This increase of population is due partly to the extension of the town limits.

^e Estimated to the Census of 1911 by age and sex, while the town of Kalmunai was created a registration division only in January, 1914, and Ambalangoda in January, 1915. The death-rates given for "All Towns" are, therefore, in 1911, but are scarcely affected by their rates.

* The city-rate is worked differently from the ward-rates, and takes into account events in hospitals, &c., not assignable to wards.
 † For explanation of "standardized death-rate" see note a, Table I. The population of the several wards of the city not being available by age- and sex-constitution, their standardized death-rates cannot be calculated.
 ‡ The population of these two wards being a fluctuating one, their population cannot be estimated to the middle of 1920. Hence the Census figures are retained.
