^a The standardized death rates represent the crude death-rates multiplied by the respective standardizing factor in order to make correction for differences of sex- and age-constitution of the several populations in 1911, as compared with that of the Island.
^b Blanks indicate that there are no observations or rain gauges.
^c Includes population of the Negombo Local Board and registration area.
^d This increase of population is due partly to the extension of the town limits.
^e Estimated to the end of December, 1919, by natural increase method.
^f Standardized death-rates for Kalpitiya and Lunugala towns are not available, as the population of these towns has not been enumerated at the Census of 1911 by age and sex, while the town of Kalmunai was created a registration division only in January, 1914, and Ambalangoda in January, 1915. The death-rates given for "All Towns" are, therefore, independent of the towns, but are scarcely affected by their rates.

* The city-rate is worked differently from the ward-rates, and takes into account events in hospitals, &c., not assignable to wards.
 † For explanation of "standardized death-rate" see note a, Table I. The population of the several wards of the city not being available by age- and sex-constitution, their standardized death-rates cannot be calculated.
 ‡ The population of these two wards being a fluctuating one, their population cannot be estimated to the middle of 1920. Hence the Census figures are retained.
